

Raleigh Fire Department

March 2023 Power BI Dashboard

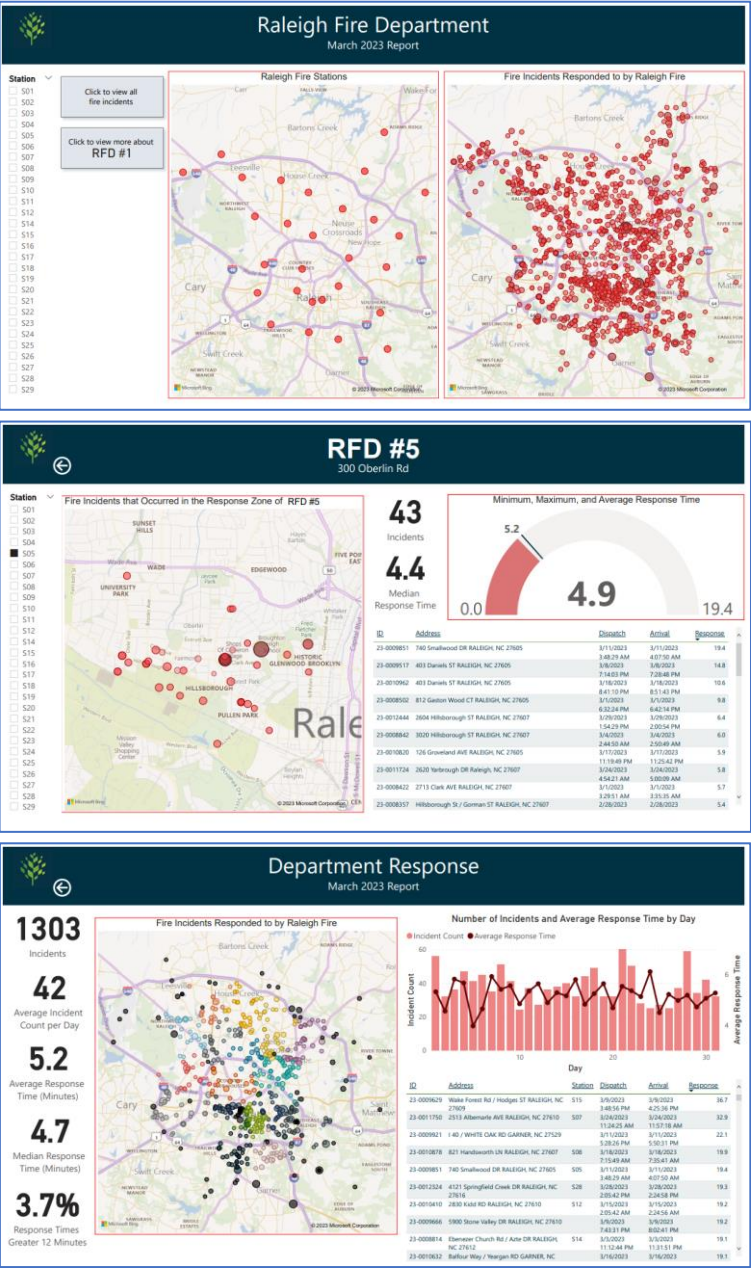

Brianna Hayes
Information Technology Intern – Enterprise Applications and Data
City of Raleigh Municipal Government

Inquiry:

If the Raleigh Fire Department wants more fire stations, their response times could be a major factor as to whether that’s a possibility. So, what are the Raleigh Fire Department's incident response times?

Applications:

- ArcGIS online
- ArcGIS pro
- Microsoft Excel
- Microsoft Power BI

Data Methods

Sources

- [Raleigh Open Data – Wake County Fire Stations](#)
- [Raleigh Open Data – Fire Incidents Past Month \(March 2023\)](#)
- [Raleigh Open Data – Fire Response Districts](#)

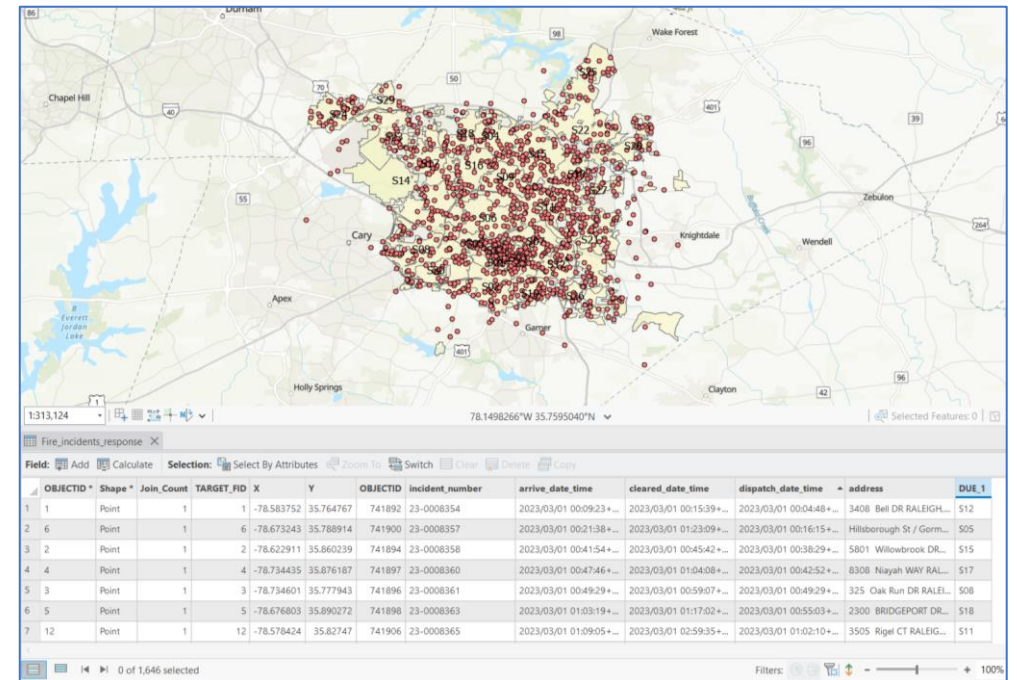

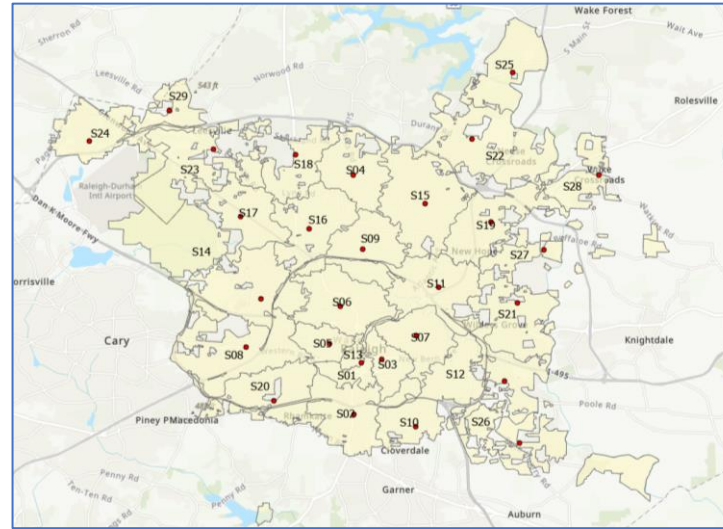

Geospatial Analysis

All three datasets were downloaded and imported into ArcGIS pro as point layers (fire station, fire incident) and geometry (fire response districts).

The fire stations dataset included all in Wake County, so it was filtered to only include those belonging to the Raleigh Fire Department.

The fire incident data did not include a primary station responding to each record. Thus, a spatial join was performed to determine which response zone each incident occurred in. While this results in inaccurate statistics for the individual stations, it demonstrates a self-guided, proactive solution that provides insights on the zones and demonstrates ArcGIS skills until a more fit solution is finalized.

The fire incident dataset, now joined with a response station, was then exported from ArcGIS pro and imported into Power BI.

```

1 response_time = DATEDIFF(
2     fire_incidents[dispatch_date_time],
3     fire_incidents[arrive_date_time],
4     SECOND
5 )/60

```

fire_incidents (1,303 rows) Column: response_time (477 distinct values)

DAX Calculations

For this report, response time is defined as the minutes between dispatch and arrival time (both of which are fields in the fire incident dataset).

To calculate response time, I used DAX to create a new column on the fire incident dataset in Power BI and found the minutes between the two times using the DATE_DIFF() function.

While I am looking for minutes, I used SECOND as the interval in this formula because MINUTE does not consider seconds in its calculations, resulting in whole numbers. For emergency response times, even 30 seconds could make a big difference. Thus, it is important to be precise.

It is also important to use the DATE_DIFF() function here rather than simply subtracting times. If the fire department is dispatched at 11:59 pm, and the arrival time is 12:05 am, the response time would be inaccurate if subtracted. Date is an important factor.
